Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>
	10/677,241	SAKIDA, HIDEYUKI
	Examiner Jeffrey S. Smith	Art Unit 2624

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) Responsive to communication(s) filed on 27 August 2007.
- 2a) This action is FINAL.                    2b) This action is non-final.
- 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) Claim(s) 1-6 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) Claim(s) \_\_\_\_\_ is/are allowed.
- 6) Claim(s) 1-6 is/are rejected.
- 7) Claim(s) \_\_\_\_\_ is/are objected to.
- 8) Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) The specification is objected to by the Examiner.
- 10) The drawing(s) filed on \_\_\_\_\_ is/are: a) accepted or b) objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) All    b) Some \* c) None of:
  1. Certified copies of the priority documents have been received.
  2. Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### *Double Patenting*

Claims 1-6 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-10 of U.S. Patent No. 7171031 ("031") in view of Physical Principles of Medical Imaging, 2<sup>nd</sup> Edition, by Perry Sprawls, Jr., chapter 18 pages 253-265, 1993 ("Sprawls").

Claim 1 of the '031 patent recites

(a) **obtaining at least three first differential signals** representing differentials between one image signal and another image signal on the basis of at least four image signals **obtained by detecting intensity** of radiation on at least four planes that are parallel and positioned at different distances from the object, said at least four image signals respectively representing radiation image information on said at least four planes; ... (c) **obtaining a Laplacian of phase** on the basis of the at least three image signals and at least three sets of the first to third differential signals; and (d) **performing inverse Laplacian operation** on the Laplacian of phase so as to restore phase information.

which reads on claim 1 of the application

(a) **obtained by detecting intensity** of radiation on plural detection planes at different distances from the object, said plural sets of detection data representing radiation image information on the plural detection planes, respectively; (b) **obtaining differential data** representing difference between first detection data and second detection data of said plural sets of detection data; (c) **obtaining Laplacian of phase** on the basis of said differential data and any one of said plural sets of detection data and the detection data; and (d) **obtaining phase data of the radiation by performing inverse Laplacian computation** on the Laplacian of phase.

Claim 1 of the '031 patent does not recite correcting blur amount. Sprawls discloses correcting blur amount by filter processing using a function of spatial frequencies (compare figure 5 of the application which shows a function of spatial

frequencies for correcting blur with figures 18-7, 18-8 and 18-9 of Sprawls which show the same function).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify claim 1 of the '031 patent to correct blur using a function of spatial frequencies for the benefit of removing blur as taught by Sprawls.

Claims 1-6 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-3 of U.S. Patent No. 6704591 ("591") in view of Physical Principles of Medical Imaging, 2<sup>nd</sup> Edition, by Perry Sprawls, Jr., chapter 18 pages 253-265, 1993 ("Sprawls").

Claim 1 of the '591 patent recites

A method of restoring phase information of radiation transmitted through an object on the basis of a plurality of image signals respectively **obtained by detecting intensity** of radiation transmitted through the object on a plurality of planes different in distance from the object, each of the plurality of image signals representing radiation image information on the plurality of planes, said method comprising the steps of: **obtaining a differential signal** representing difference between a first image signal and a second image signal of said plurality of image signals; ... **obtaining Laplacian of phase** with respect to said differential signal and said third image signal; and restoring phase information of the radiation by **applying an inverse Laplacian operation** to said Laplacian of phase.

which reads on claim 1 of the application

(a) **obtained by detecting intensity** of radiation on plural detection planes at different distances from the object, said plural sets of detection data representing radiation image information on the plural detection planes, respectively; (b) **obtaining differential data** representing difference between first detection data and second detection data of said plural sets of detection data; (c) **obtaining Laplacian of phase** on the basis of said differential data and any one of said plural sets of detection data and the detection data; and (d) **obtaining phase data of the radiation by performing inverse Laplacian computation** on the Laplacian of phase.

Claim 1 of the '591 patent does not recite correcting blur amount. Sprawls discloses correcting blur amount by filter processing using a function of spatial frequencies (compare figure 5 of the application which shows a function of spatial frequencies for correcting blur with figures 18-7, 18-8 and 18-9 of Sprawls which show the same function).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify claim 1 of the '591 patent to correct blur using a function of spatial frequencies for the benefit of removing blur as taught by Sprawls.

Claims 1-6 are provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 3-4 and 11-12 of copending Application No. 10/671,786 ("786") in view of Physical Principles of Medical Imaging, 2<sup>nd</sup> Edition, by Perry Sprawls, Jr., chapter 18 pages 253-265, 1993 ("Sprawls").

Claim 3 of the '786 application recites

(a) **obtaining plural sets of detection data** respectively representing plural kinds of radiation image information on plural detection planes at different distances from the object by using a radiation having a predetermined wavelength with energy from 16 keV to 30 keV to **detect intensity** of the radiation on said plural detection planes; and (b) restoring phase information on the radiation transmitted through the object on the basis of **obtaining a differential coefficient** between said plural sets of detection data; so-as-to obtain phase data (c) **calculating a Laplacian of phase** on the basis of said differential coefficient and any one of said plural sets of detection data; and (d) **performing inverse Laplacian computation** on the Laplacian of phase to obtain the phase information.

which reads on claim 1 of the application

(a) **obtained by detecting intensity** of radiation on plural detection planes at different distances from the object, **said plural sets of detection data** representing radiation image information on the plural detection planes, respectively; (b) **obtaining differential data** representing difference between first detection data and second detection data of said plural sets of detection data; (c) **obtaining Laplacian of phase** on the basis of said differential data and any one of said plural sets of detection data and the detection data; and (d) **obtaining phase data of the radiation by performing inverse Laplacian computation** on the Laplacian of phase.

Claim 3 of the '786 application does not recite correcting blur amount. Sprawls discloses correcting blur amount by filter processing using a function of spatial frequencies (compare figure 5 of the application which shows a function of spatial frequencies for correcting blur with figures 18-7, 18-8 and 18-9 of Sprawls which show the same function).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify claim 3 of the '786 application to correct blur using a function of spatial frequencies for the benefit of removing blur as taught by Sprawls.

This is a provisional obviousness-type double patenting rejection.

#### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gureyev (cited in the previous action) in view of Sprawls (cited above).

For claims 1, 3 and 5, Gureyev discloses "plural sets of detection data obtained by detecting intensity of radiation on plural detection planes at different distances from the object, said plural sets of detection data representing image information on the plural detection planes." (See abstract, "the appropriate processing of phase-contrast images obtained in the in-line geometry." See also Figures 1 and 2 and page 361 "We then computed the free-space propagation (calculating the full Kirchhoff integrals) of that complex amplitude from the plane z=0 to z=0.15m." Applicant also admits that this feature is prior art in the background section and at page 17).

Gureyev discloses "obtaining differential data representing difference between first detection data and section detection data of said plural sets of detection data." (See page 357, "processing of the differential images.")

Gureyev discloses "obtaining Laplacian of phase on the basis of said differential data and any one of said plural sets of detection data." (See equation 3a on page 357).

Gureyev discloses "obtaining phase data of the radiation by performing inverse Laplacian computation on the Laplacian of phase." (See page 360 "There are many well-known methods for solving equations of the type (2) and (3)").

Gureyev does not disclose "correcting blur amount by filter processing using a function of spatial frequencies."

Sprawls discloses "correcting blur amount by filter processing using a function of spatial frequencies." (compare figure 5 of the application which shows a function of spatial frequencies for correcting blur with figures 18-7, 18-8 and 18-9 of Sprawls which show the same function).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Gureyev to correct blur using a function of spatial frequencies for the benefit of removing blur as taught by Sprawls. In this particular case, the technique of correcting blur amount by filter processing using a function of spatial frequencies was part of the ordinary capabilities of one skilled in the art. Applying the known technique of Sprawl's blur correction to Gureyev's differential data would have yielded predictable results of blur corrected phase data to one of ordinary skill in the art at the time of the invention. Furthermore, obtaining Laplacian of phase on the basis of differential data, detection data before correcting blur, and detection data after correcting blur would be obvious to try, because the only options available to one of ordinary skill, after reading Sprawl's blur correction, are using blur corrected differential data, blur uncorrected differential data, blur corrected detection data and blur uncorrected detection data in Gureyev's method of phase contrast imaging. The claim would have been obvious because a person of ordinary skill has good reason to pursue these known options that are within his or her technical grasp.

For claims 2, 4 and 6, figures 18-7, 18-8 and 18-9 show multiple blur functions that are used to remove blur amounts caused by a focal size ("focal spot blur" page 262). Removing the blur amounts uniformly was within the ordinary capabilities of one skilled in the art using the several functions of Sprawl.

***Response to Arguments***

Applicant's arguments with respect to claims 1-6 have been considered but are moot in view of the new ground(s) of rejection.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jeffrey S. Smith whose telephone number is 571 270-1235. The examiner can normally be reached on M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jingge Wu can be reached on 571 272-7429. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
